

Experiment: Elmer E■■■■■■■■■

Scientists: J■■■ B■■■■■■■■■ and B■■■■■■■■ L■

Test: Chemical Y

02/06/■■■■■:

The subject has received the sandwich with the Chemical Y that we are testing. This should allow a change in appetite without allowing the subject to notice any changes in his behavior. We tossed in a small “light show” to familiarize him with the lasers, and to see if notices an increase or change in their positions. If he doesn’t, this could be used to ■■■■■■ ■■ ■■■■■■■■■■!

02/07/■■■■■:

Starting small, though I guess in a way we’re starting big. The subject has eaten an entire pizza. There are plenty of people who do that, but the subject was never one of them. However, he doesn’t seem to notice any strange behavior on his part just yet. One step closer to our goal.

02/08/■■■■■:

An entire Thanksgiving feast! Enough food for a large family to have for two days, and he managed to eat it all! This chemical is stronger than we ever thought possible. The subject still doesn’t notice anything strange. However, our funding is running low, and some of the platforms look weak.

02/09/■■■■■:

The bottle of glue did so much for us... yet set us back a few steps. We were able to change his appetite to want something inedible, but he started to notice. But ■■■■■■■■ ■■ won’t be satisfied with that. They’ll want us to go bigger. Our funding is almost out.

02/10/■■■■■:

This day was a cross with experiment ■■■■■■■■■■. To think they could fit a city in a bag! However, our own funding has dried up. We don’t even have enough food for another meal for the experiment. Even worse, the subject seems to have grown dependent on the meals. We’ll just have to leave an empty bag and hope that he doesn’t notice until we’re far away.
